Brief Introduction

Our project focuses on the implementation of Python CRUD for data collection of a humanitarian foundation's donations. We use an SQL database as data storage connected to Python with the SQL connector feature.

Python Configuration

 donationPDF.py ×

```
1 import mysql.connector, sys, os
2 from decimal import Decimal, InvalidOperation
3 from datetime import datetime
4 from admin_auth import passLoop, set_password
```

 admin_auth.py ×

```
1 import sys, hashlib, hmac, json, secrets, pwinput
2 from pathlib import Path
```

We use 2 python files, where the first file is used to store the code for data processing, and the second file is for password management.

```
14 DB_CONFIG = {
15     "host": "localhost",
16     "user": "root",
17     "password": "56&abcABC",
18     "database": "donationDataSys_db"
19 }
```

```
33 def get_connection(): 6 usages
34     return mysql.connector.connect(**DB_CONFIG)
```

```
404     conn = get_connection()
405     cur = conn.cursor(dictionary=True)
```

```
428     finally:
429         cur.close()
430         conn.close()
```

First, we need to install the connection library with the command **pip install mysql-connector** in the terminal.

After that, we can create a connection to the database. The database we will use is called **donationDataSys_db**.

So when it has been defined at the beginning, then in the functions that will be used, it can simply be called within the def to open the connection, and at the end to close the connection.

```

37 def safe_input(prompt, default=None, required=False): 31 usages
38     while True:
39         s = input(prompt).strip()
40         if s == "" and default is not None:
41             return default
42         if required and s == "":
43             print("Field must be filled.")
44             continue
45     return s

```

safe_input for the input. If **required=True** and you press Enter, it shows “Field must be filled.” and asks again until you type something.

normalize for standarization/shortening inputs to a single form, for example on line 52, typing “personal”, “person”, or “p” all becomes “per”.

```

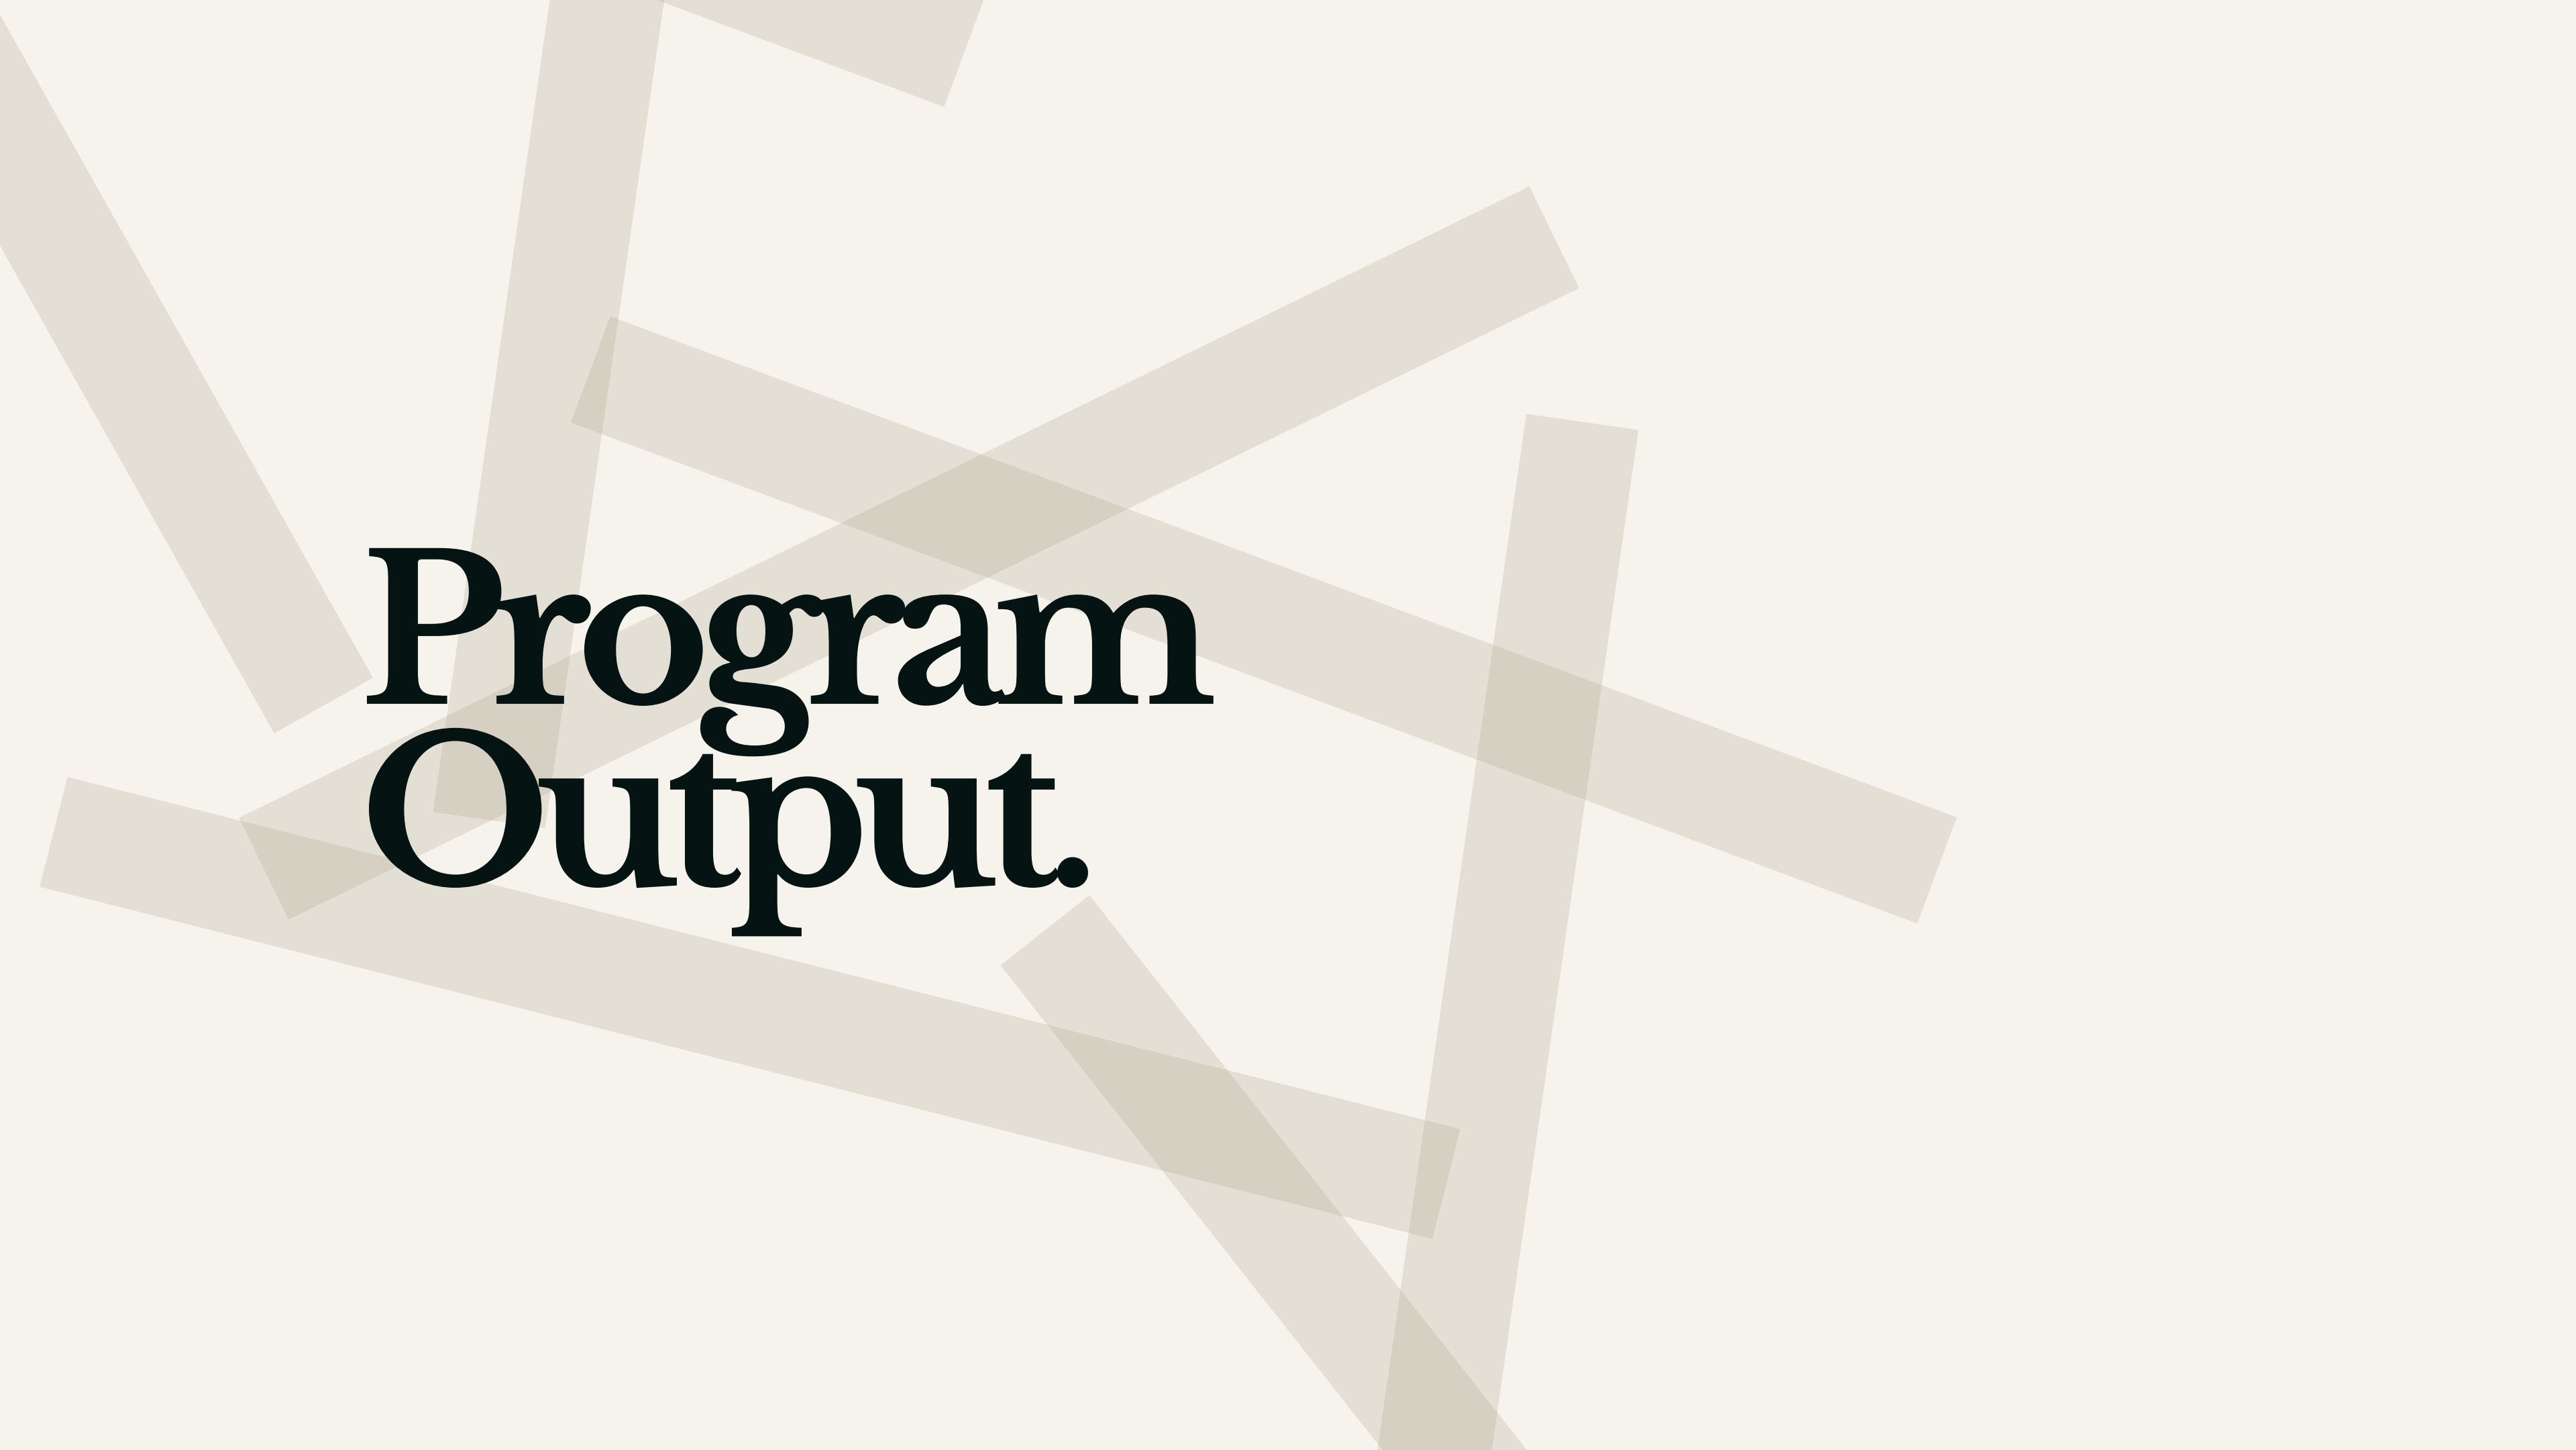

59 def normalize_kind(s): 2 usages
60     if not s:
61         return None
62     s = s.lower().strip()
63     if s in ("barang", "i", "g"):
64         return "items"
65     if s in ("money", "uang", "m"):
66         return "money"
67     return s

```

```

48 def normalize_base(s): 2 usages
49     if not s:
50         return None
51     s = s.lower().strip()
52     if s in ("personal", "person", "per", "p"):
53         return "per"
54     if s in ("company", "com", "c"):
55         return "com"
56     return s

```
